## HYBRID ROCKET PROPULSION

*Allen L. Holzman*

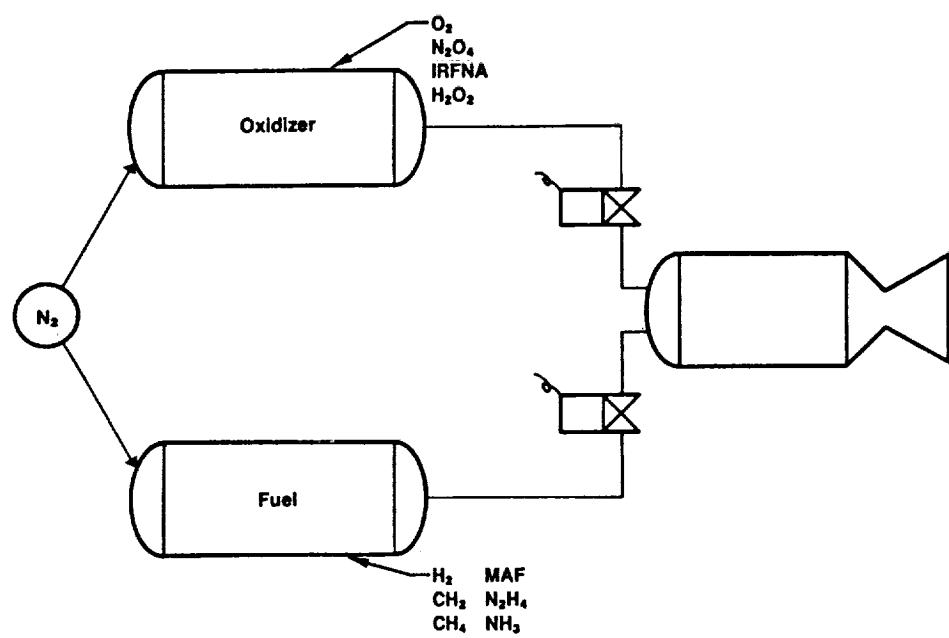

UNITED TECHNOLOGIES/CHEMICAL SYSTEMS  
SAN JOSE, CALIFORNIA

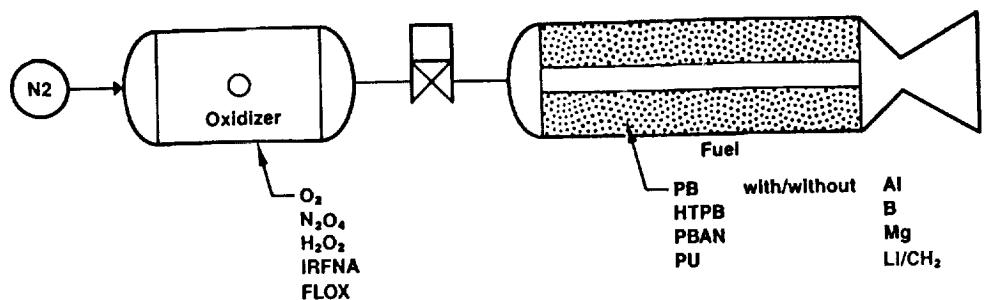

## SOLIDS

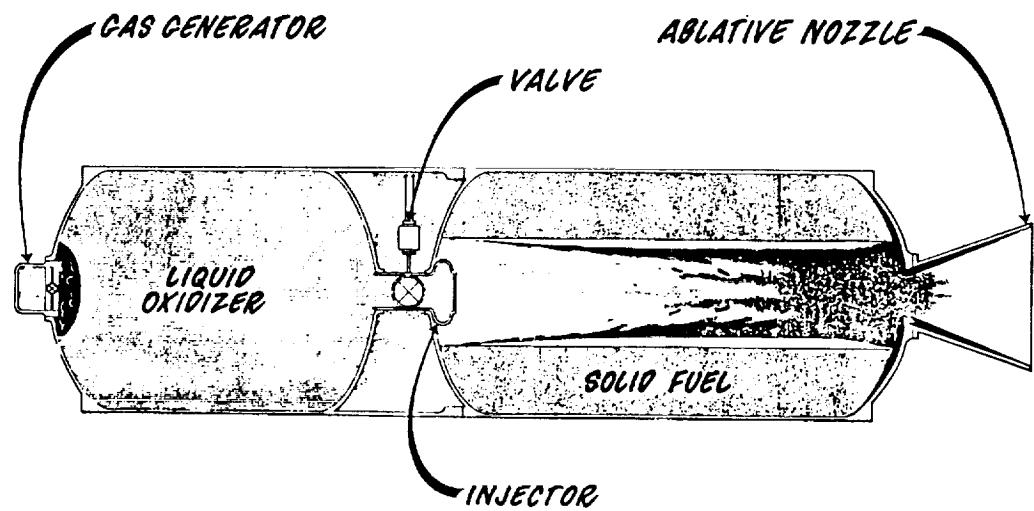

## LIQUIDS

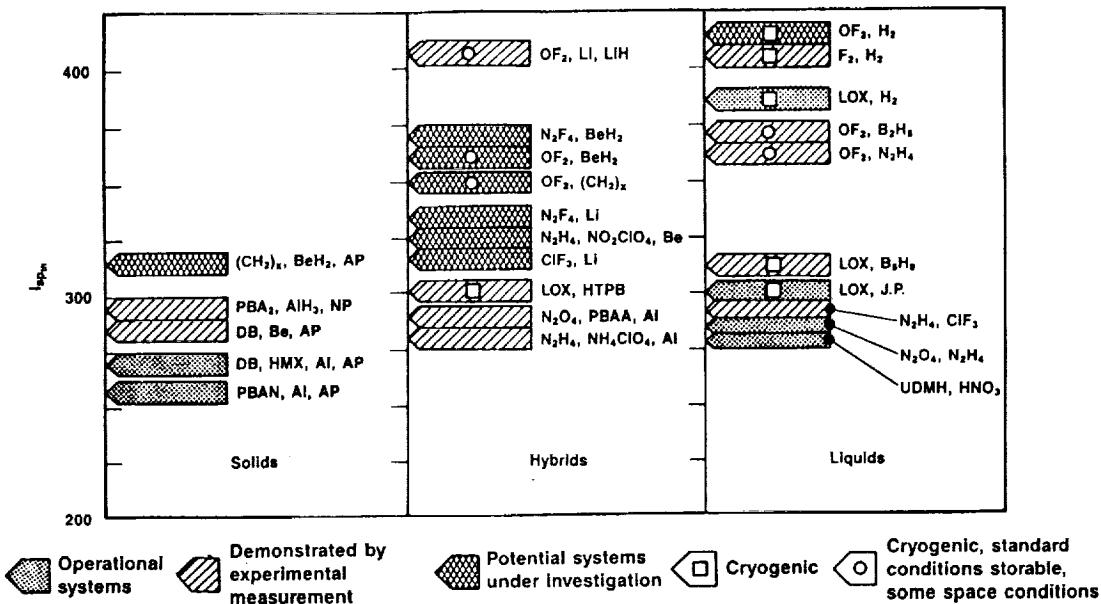

# HYBRIDS

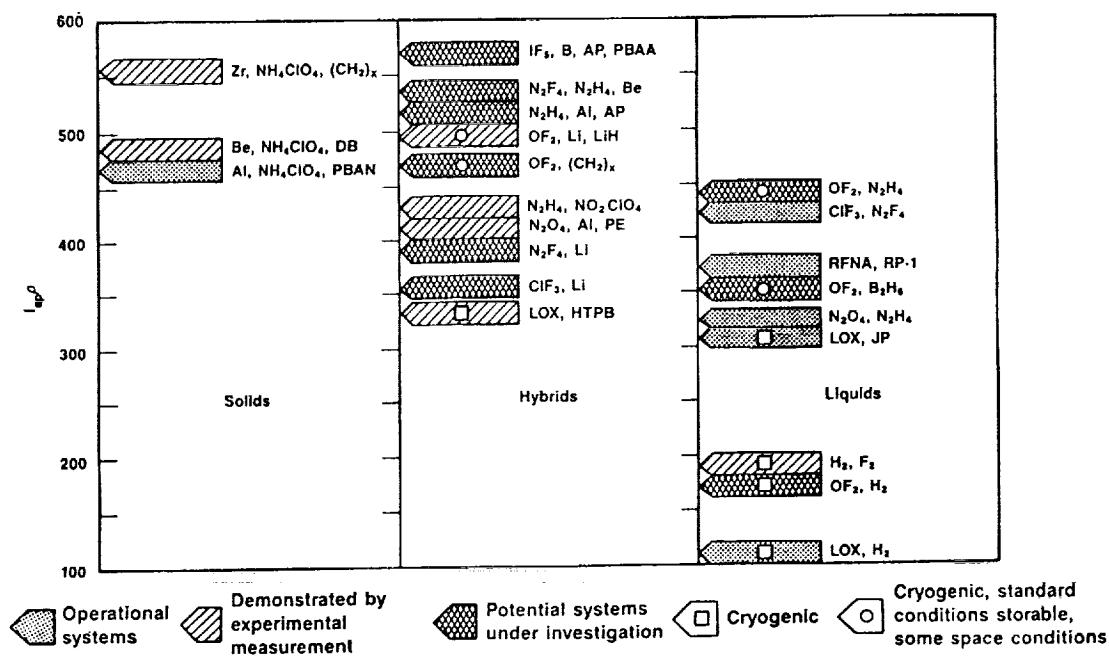

## HYBRID ENGINE OPERATION

# COMPARISON OF THE THEORETICAL SPECIFIC IMPULSES ATTAINABLE WITH SOLID, LIQUID AND HYBRID PROPELLANT SYSTEMS

# COMPARISON OF THE DENSITY-SPECIFIC IMPULSES ATTAINABLE WITH SOLID, LIQUID AND HYBRID PROPELLANT SYSTEMS

#### HISTORY

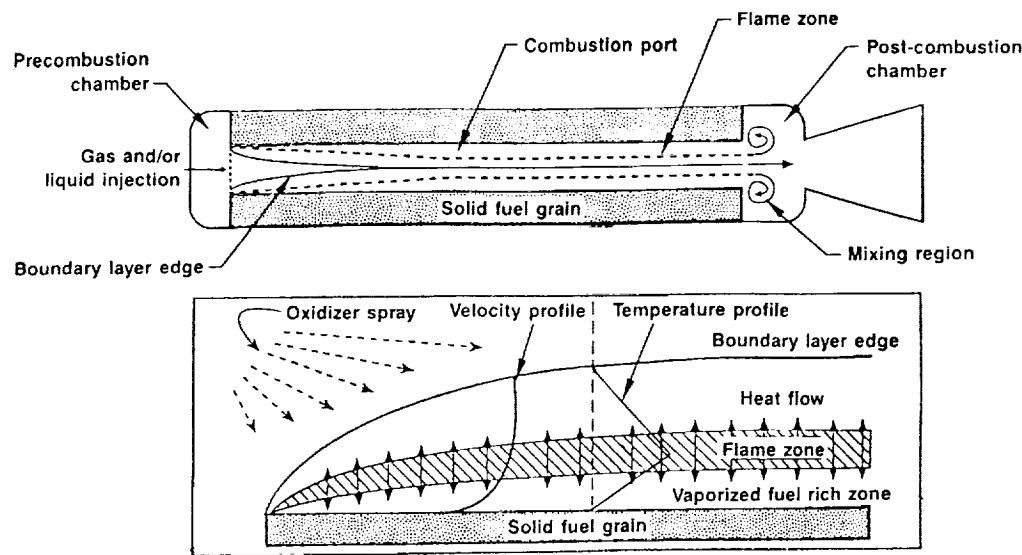

- o 1930's California Rocket Society - static tests
- o 1940's - 50's Pacific Rocket Society - LOX/Douglas fir fuel flight tested to 30,000 ft.
- GE - evaluated  $\text{B}_2\text{O}_3/\text{PE}$  engine
- o 1950's - 60's APL - reverse hybrid  $\text{NH}_4\text{NO}_3/\text{JP}$
- o 1960's - 70's CSD - fundamental regression/combustion studies
  - supersonic target drones, flight tests (Sandpiper/BAST/Firebolt)
  - High energy FLOX/Li/LiH/HTPB tests 380-sec  $I_{sp}$ , @ 40/1 expansion ratio
  - 50K-lb thrust  $\text{N}_2\text{O}_4/\text{Al/PBAN}$
- ONERA/SNECHA/SEP -  $\text{HNO}_3/\text{amine}$  fuel, sounding rockets, flight tests
- o 1980's AMROC - 50K-lb thrust LOX/PB
- o 1990's AMROC - 75K-lb thrust LOX/PB

**HPIAG**

## GENERAL PROPULSION SYSTEM FEATURES COMPARISON

Feature	Solid	Liquid LOX-JP	Classical Hybrid
DOT classification	Class B	Inert when-MT	Inert
Explosive classification	1.3	60% TNT equiv. when full	NA
Sensitivity to grain cracks/voids	Yes	NA	No
Launch abort capability (propulsion termination)	No	Yes	Yes
Handling costs	Highest	Medium	Lowest
$I_{sp}$	Low	High	High
$\rho I_{sp}$	High	Low	Medium
Exhaust HCl	20%	0	0
Exhaust particulate	High	Low	Either

# HYBRID COMBUSTION BOUNDARY LAYER

## BASIC HYBRID BURNING RATE LAWS

**Elementary pipe flow**

$$\dot{Q}_w = \dot{m}_f h_v = (h/c_p) \Delta h_c$$

$$\therefore \dot{r} = \frac{1}{\rho_f c_p} \left( \frac{\Delta h_c}{h_v} \right)$$

$$\text{with } h \propto \frac{c_p G^{0.8}}{D^{0.2}} \quad (\text{turbulent pipe flow})$$

**Refined relation**

$$\dot{r} = \left( \frac{0.036 \mu^{0.2}}{\rho_f \times 0.2} \right) \left( \frac{C_H}{C_{H_0}} \right) \left( \frac{U_e}{U_b} \right) \left( \frac{\Delta h_c}{h_v} \right) G^{0.8} + \frac{Q_R}{\rho_f h_v}$$

**Good working equation**

$$\dot{r} = a G_o^n$$

$Q_w$  = heat flux to wall (fuel)

$m_f$  = fuel flow rate

$h_v$  = effective heat of vaporization

$\Delta h_c$  = heat of combustion of fuel

$G$  = mass flux in port

$U$  = gas velocity

#### WHY AREN'T HYBRIDS OPERATIONAL?

- o Operational success of liquid F-1 engines and SRM boosters for the shuttle and Titan III caused interest in hybrids to wane.
- o Early emphasis was only for high density impulse systems. Cost, safety, environmental and reliability issues were of second order.
- o All the 1960s and 70s work in hybrids was done by primarily liquid and solid propulsion companies. In any selection process for upcoming systems, hybrids were always perceived second best.
- o Customer liquid and solid propulsion communities (incumbents) are not interested in sharing funding.
- o It is difficult to generate funding for an order of magnitude scale increase to 750K and larger thrust engines.
- o "Political factors interfere with technical factors."

HPIAG

#### HYBRID SYSTEMS

#### BOOSTER APPLICATIONS

## ATLAS BOOSTER DEVELOPMENT AND QUALIFICATION

	Year					
	1	2	3	4	5	6
1. Fuel formulation studies	X-----X					
2. Sub-scale port tests	X-----X					
3. Injector development	X-----X					
4. Analytical modelling	X-----X					
5. Trade studies	X-----X					
6. Full-scale motor tests		X-----X				
7. Nozzle development			X-----X			
8. Throttling tests				X--X		
9. Process develop & verif.		X-----X				
10. Full scale qualification testing				X-----X		

## HYBRID SYSTEM ADVANTAGES

### BOOSTER APPLICATIONS

	Hybrids	Solids	Liquids
Explosive hazard	none	high	high
HCl in exhaust	none	high	none
Specific impulse	high	low	highest
Density impulse	high	highest	lowest
Throttlesability	yes	no	yes
On pad costs	low	high	high
System cost	low/medium	medium	high
Abort capability	yes	no	yes
Understanding of basic analytical regression/ combustion model	yes	no	no

## COMPARISON OF THROAT BETAS

	O/F	T <sub>R</sub>	Beta	t <sub>spec</sub> sec	c ft/sec	m/l Al <sub>2</sub> O <sub>3</sub> @ throat
Solid propellant ASRM TP-H-1233	--	6411	0.096	287.	5178	0.096
LOX/Hydrogen	5.0	6110	0.626	433.	7951	--
LOX/100% HC	2.37	6698	0.269	323.	5830	--
LOX/35% aluminum/ 65% HC	1.36	7149	0.130	321.	5786	.084
LOX/45% Aluminum/ 55% HC	1.17	7377	0.083	319.	5716	.134

All values theoretical for P<sub>c</sub> = 1000 psia, nozzle area ratio = 10.0

## HYBRID SYSTEM DISADVANTAGES

### NON-METALLIZED FLOW

### BOOSTER APPLICATIONS

	Hybrids	Solids	Liquids
Nozzle erosion	high	low	n.s.(regeneratively cooled)
Residual fuel/ox	6%/1%	<< 1%	< 1%
Accumulated data	low	high	high

## HYBRID SYSTEMS

### UPPER STAGE PROPULSION APPLICATIONS

#### UPPER STAGE HYBRID MOTOR DEVELOPMENT AND QUALIFICATION

	Year

## Augustine Report Excerpts on the Future of the U.S. Space Program

**"Over the longer term, the nation must turn to new and revolutionary technologies..."**

- More capable and significantly less costly means to launch manned and unmanned spacecraft
- Architecture studies now underway will define capable, low-cost launch vehicles
- Maintain vigorous advanced launch system technology program
  - Enhancement of current fleet
  - Basis for revolutionary launch systems

## Hybrid Propulsion Positively Addresses OAST's Civil Space Transportation Requirements

## An Industry Consensus on the Hybrid Potential

- Radically improves safety in all phases of manufacture, vehicle stacking/assembly, and flight, and reduces environmental concerns
- Offers a reasonable design alternative to large clusters of LO<sub>2</sub>/LH<sub>2</sub> engines for heavy-lift boost propulsion
- May enable major reduction in booster life cycle costs

*The United States aerospace community cannot afford to overlook the hybrid propulsion option*

## Review of Initial NASA Hybrid Propulsion Technology Program

- Phased technology acquisition and demonstration
  - Initial approach to technology acquisition resulting from formulation of NASA-HPT program
  - Address technology deficiencies in series of graduated subscale motor tests (Phase II)
  - Demonstrate technology at 1.5 Mlbf thrust level (Phase III)

Calendar Year	88	89	90	91	92	93	94	95	96	97	\$M
HPT Phase I Identify the Necessary Technology (four contracts)		▼	▼								2.1
HPT Phase II Acquire the Technology (two contracts)				Award			Complete				16
HPT Phase III Demonstrate the Technology in a Large Subscale System				Nov		May	CBD		Complete	Jan	25

Total Funding Commitment Required is \$41M

- Problems
  - Technology development does not demonstrate large-scale feasibility in time frame required for heavy-lift (SEI) applications
  - Does not utilize national aerospace assets (HPIAG)

## An Alternative Development Approach Provides A Fast Track Large-Scale Hybrid Demonstration

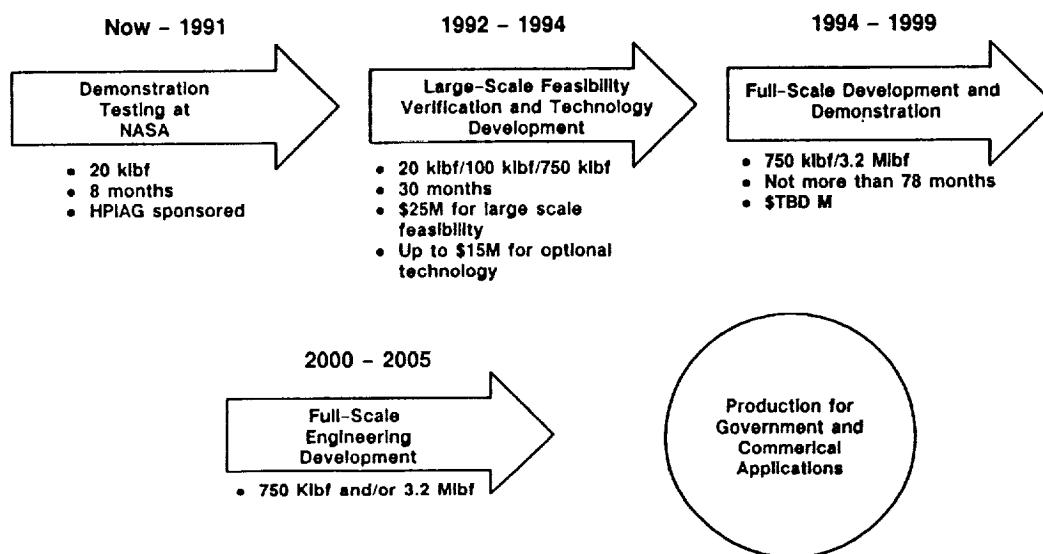

- Focused technology acquisition and demonstration
  - Approach suggested by J. R. Thompson based on successes of F-1 engine and large solid rocket motor development
  - Define specific technical issues for large booster development via early testing of Shuttle SRM-scale hybrid

- Problems

- Effort includes a large-scale feasibility demonstration only—subsequent mix of subscale and full-scale demonstrations to address point design problems requires definition

## Final HPT Development Approach Recommended to J. R. Thompson in December 1991

**Recommended HPT Program Was Included In Budget  
Request From MSFC and LeRC for GFY 93  
Start—Subsequently Pushed to GFY 95**

<b>Thrust: TRANSPORTATION-AUGMENTATION NEW START</b>		<b>Date:</b> <u>2/21/91</u>
<b>Key Technology Objective:</b> <u>3.0 Provide Technologies to Support the Development of a Robust, Cost Effective Heavy-Lift Capability</u>		
<b>Specific Objective:</b> <u>3.7 Develop Technologies for Achieving Low Cost Booster Options and Demonstrate at an Appropriate Scale</u>		
<b>TARGET MILESTONE:</b>		
<b>Centers</b>	<b>WBS</b>	<b>TASK TITLE: TRANSPORTATION-HYBRID</b>
MSFC	590-21-XX	<p>1993 Authority to release NASA Research Announcement for Hybrid Booster Technology Program</p> <p>1993 Award contracts to begin development and testing of both Gas Generator and "Classical" Hybrid test motors</p> <p>1994 Complete 100 klbf testing</p> <p>1994 Initiate development of 750 klbf test motors for both "Classical" and Gas Generator concepts</p> <p>1996 Test both Hybrid Booster concepts at 750 klbf testing</p> <p>1996 Complete analysis of performance data and validation of analytical models</p> <p>1996 Complete documentation</p>
LeRC	590-21-XX	<p>1993 Begin development of analytical models and materials data base</p> <p>1995 Validate models at 100 klbf level</p> <p>1996 Validate models at 750 klbf level and extrapolation of Hybrid unique scaling data</p>

**Near-Term HPIAG Initiative Provides Program Bridge  
to GFY 95 HPT New Start**

**Program concept: Combine industry discretionary resources with NASA R&T funds to begin near-term HPT development**

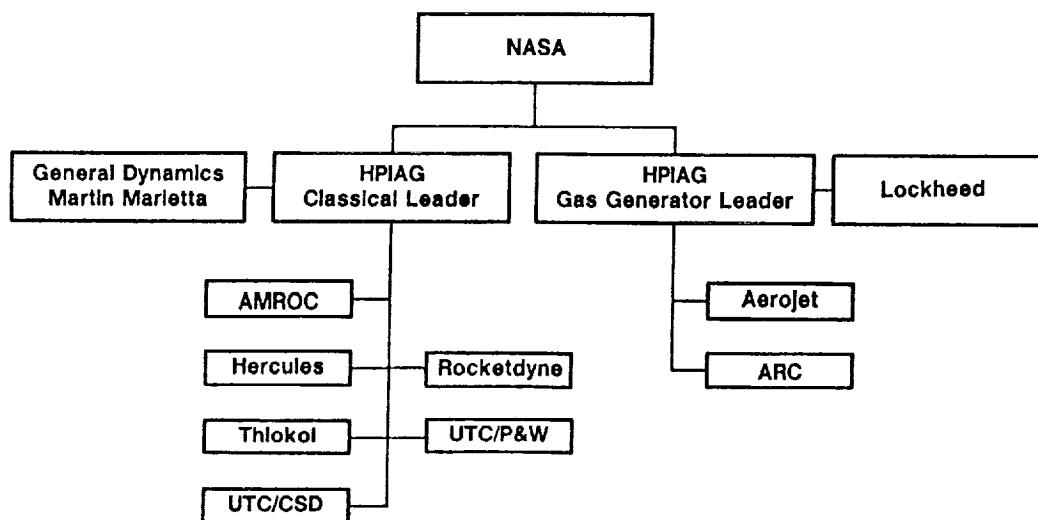

- **Initiate basic technology studies at JPL**
- **Explore technical feasibility of hybrid propulsion for space launch applications via subscale and small-scale hybrid motor tests:**
  - Both classical and aft injection cycles
  - 500-lbf, 15-klbf, 150-klbf motors (typical thrust levels)
- **Begin limited hybrid propulsion launch vehicle infrastructure studies:**
  - Operability issues
  - Reliability evaluation
  - Cost
- **Develop program bridge to \$40M CSTI effort**

## Multiple Motor Scales Provide Initial Feasibility Evaluation and Hardware Basis for NRA Follow-on Work

Motor Thrust Level	Classical Objectives	Aft Injection Objectives
500 lbf	<ul style="list-style-type: none"> <li>• Fuel regression rate characteristics</li> <li>• Effects of defects</li> <li>• Throttle response characteristics</li> </ul>	<ul style="list-style-type: none"> <li>• GG propellant ballistic characteristics</li> <li>• Effects of defects</li> <li>• Initial concept throttling characteristics</li> </ul>
15 klbf	<ul style="list-style-type: none"> <li>• Fuel regression scale-up characteristics</li> <li>• Multiple-port grain retention and fuel utilization</li> <li>• Combustion stability and efficiency</li> </ul>	<ul style="list-style-type: none"> <li>• GG propellant scale-up characteristics</li> <li>• LO<sub>2</sub> injector feasibility verification</li> <li>• Combustion stability and efficiency</li> </ul>
150 klbf	<b>Initial HPT demonstrations at thrust level of significance for potential launch vehicle application</b>	

## Recommended NASA/HPIAG Organization to Accomplish Goal

- Create two consortiums to pursue development of both classical and gas generator engine cycles
- Companies and NASA initially linked by MOU

# **Bridge Program Elements**

- Program duration 24 months
  - Program total cost \$5.6M
    - \$1.1M industry discretionary
    - \$4.5M NASA R&T funds
  - Three basic program tasks include both classical and aft injection cycles
    - Task 0--JPL Fundamental Studies (Hybrid Rocket Technology Program)
    - Task 1--Launch Vehicle Infrastructure Studies
    - Task 2--Motor Evaluation and Demonstration

## **Program Master Schedule**

#### **9.4.2 Reliability of Solid Rocket Motor Cases and Nozzles by J.G. Crose**
